fantasy film. It is one of the first films ever to be shot entirely in

the .Q: Coercing a variable in a LEFT JOIN to the type of a column on the left side I have a query like this: `SELECT * FROM Table1 LEFT JOIN Table2` Table2 has only one field, and it is a varchar called status. Table1 has several fields, and the field I want to join on is int2. There are no matching criteria between the fields in Table1 and the fields in Table2. I need to know the value that status has, and if it is 1, I need to return all the rows from Table1, and if the value is 2, then I want to return all the rows from Table2. I don't want to convert the varchar to an int, I want to just change the type of status, and have the value to reference use with the LEFT JOIN. Basically I want the query to look like this: `SELECT * FROM Table1 LEFT JOIN`

Table2 ON '\$type' = status I'm coming from having to do this with a SQL query. This is way easier with PHP. I want the query to be from the server. Table2 could change in the future, and I can't use a different query (i.e. not on the server). The only thing I have to work with is the value from status. What type of statement would let me do this?

[Bharat] Biopics movies torrent or any other torrent from Other TV category. Hannibal.S01E11..Q: Extending an already existing array by a new element I know the title is confusing but I want to explain the question. Basically I have the following array: [{ "name": "james", "surname": "sherlock", }, { "name": "Robert", "surname": "sherlock", }, { "name": "Andrea", "surname": "kary", }] And I want to "extend" it by a new value: ["james", "Robert"] Is there any way to do it? A: Iterate through the array, generate a new object with the extra field, and then push that

```
into the array: const array = [ {
  "name": "james", "surname":
"sherlock", }, { "name": "Robert",
  "surname": "sherlock", }, {
  "name": "Andrea", "surname":
    "kary", } ];
array.push(...array.map(o =>
  ({name: o.name + ", " +
    o.surname})));
console.log(array); [Juvenile
  angiofibroma: fibrous
  histiocytoma of the subcutis].
Juvenile angiofibroma is a locally
aggressive fibrohistiocytic tumour
of bone and soft tissues. Their
histogenesis is
